

AMENDMENTS TO THE CLAIMS

1. (Currently amended) A telecommunication device comprising:

a receiving module for receiving a telephone call for a user from a calling device;
and

a processor for identifying a dialed telephone number associated with the call, said processor using the dialed telephone number to retrieve from a storage medium a first telephone number associated with a first communication device, a second telephone number associated with a second communication device, and at least one user preference, each of which being associated with the user, said processor using the at least one retrieved user preference to substantially simultaneously dial the first telephone number to form a first communication path between said processor and the first communication device by dialing said first telephone number and ~~dial the second telephone number to form a second different communication path between said processor and the second communication device by dialing said second~~ telephone number substantially simultaneously,

wherein said processor holds the call for a predetermined time until it is determined that the user has answered the first or second communication device, ~~a device associated with one of the first or second telephone numbers~~, said processor authenticates the answered device before forming a completed physical circuit connection between the calling device and the answered device, and routes the call to the answered device by connecting the calling device to the formed communication path connected to the answered device.

Claim 2. (Canceled)

3. (Currently amended) The device of claim [[2]] 1, wherein said processor routes the call to a ~~third retrieved destination number associated with a~~ voice mailbox telephone number after the predetermined time expires ~~as defined by the at least one retrieved user preference.~~

4. (Original) The device of claim 3, wherein said predetermined time corresponds to a number of telephone rings defined by the at least one retrieved user preference.

Claims 5-8. (Canceled)

9. (Previously presented) The device of claim 1, wherein said processor prompts a caller of the telephone call with a menu of call destination options and said processor places the call to at least one retrieved telephone number in accordance with an option selected by the caller.

10. (Currently amended) The device of claim 1, wherein said processor receives the call from a private branch exchange, and wherein ~~[[the]]~~ at least one retrieved telephone number is associated with the private branch exchange.

11. (Previously presented) The device of claim 10, wherein the call is routed to a retrieved telephone number associated with a cellular telephone.

12. (Original) The device of claim 11, wherein the cellular telephone can operate independently from the telecommunication device.

13. (Previously presented) The device of claim 10, wherein the call is routed to a retrieved telephone number associated with a pager.

14. (Previously presented) The device of claim 10, wherein the call is routed to a retrieved telephone number associated with a personal digital assistant.

15. (Currently amended) The device of claim 1, wherein said processor receives the call from a public switched telephone network, and wherein [[the]] at least one retrieved telephone number is associated with a private branch exchange connected to the telecommunication device.

16. (Previously presented) The device of claim 15, wherein said processor routes the call to a plurality of additional retrieved telephone numbers, wherein at least one additional retrieved telephone number is associated with a cellular telephone.

17. (Original) The device of claim 1, wherein said processor is connected to a local area network and the at least one user preference is input via the local area network.

18. (Original) The device of claim 1, wherein said processor is connected to the Internet and the at least one user preference is input via the Internet.

Claims 19-27. (Canceled)

28. (Currently amended) A method of providing telecommunications to a user of [[an]] a communication network, the method comprising the steps of:

connecting the communication network to a connect unit;

providing a first communication device associated with the user at an extension of the communication network ~~associated with the user~~;

providing a second communication device associated with the user;

receiving a communication made to the extension at the connect unit;

holding the received communication in the connect unit;

identifying the extension from the routed communication;

using the identified extension to retrieve a first communication device number associated with the first communication device, a second communication device number associated with the second communication device, and at least one user preference associated with the user; and

forming a first communication path between the first communication device and the connect unit by placing a first call to the first communication device;

forming a second communication path between the second communication device and the connect unit by placing a second call to the second communication device, said acts of placing the first and second calls occurring substantially simultaneously;

determining if the first communication device answered the first call or if the second communication device answered the second call; and

if the first or second call is answered and authenticated, routing the received communication to the authenticated answering device by connecting the communication

~~path between the connect unit and the answered device received communication to the formed communication path associated with the answering device to the received communication to form~~ via a completed physical circuit connection.

Claim 29. (Canceled)

30. (Currently amended) A method of providing telecommunications to a user of a communication network, the method comprising the steps of:

receiving a communication at a processor;

holding the communication at the processor;

identifying ~~a communication device number~~ destination information associated with the received communication;

retrieving, based on the identified destination information ~~communication device number~~, a first communication ~~device number~~ associated with a first device connected to the communication network, a second communication ~~device number~~ associated with a wireless device and at least one user preference, each of which being associated with the user;

routing, using the retrieved at least one user preference, the communication to at least one of said first device or wireless device ~~two destination communication numbers~~ substantially simultaneously, ~~wherein the at least two destination communication numbers are selected from the group including the retrieved first and second communication numbers and a voice mailbox number, and wherein the act of routing the communication comprises by:~~

forming a first communication path between the processor and said first device ~~to the first communication device number~~ and a second communication path between the processor and said wireless device ~~to the second communication device number~~;

determining whether the first device or wireless device ~~if one of the destination communication numbers~~ has been answered; and

if it has been determined that one of the first device or wireless device ~~one of the destination communication numbers~~ has been answered, requesting information from the user before routing the held communication ~~through the formed communication path associated with~~ to the answered device, and then forming ~~destination communication number via~~ a completed physical circuit connection between the received communication and the path between the processor and the answered device.

Claim 31. (Canceled)

32. (Currently amended) The method of claim ~~[[31]]~~ 30, wherein the communication is routed to a third ~~of the at least two destination communication numbers~~ ~~corresponding to the~~ voice mailbox number after a predetermined number of rings time, as defined by the at least one retrieved user preference.

Claims 33-35. (Canceled)

36. (Currently amended) The method of claim 30, wherein the ~~communication is routed to a destination~~ second communication number is associated with a cellular telephone.

37. (Currently amended) The method of claim 30, wherein the ~~communication~~
~~is routed to a destination~~ second communication number is associated with a pager.

38. (Currently amended) The method of claim 30, wherein the ~~communication~~
~~is routed to a destination~~ second communication number is associated with a personal
digital assistant.

Claims 39-51. (Canceled)
